## Abstract

**OBJECTIVES:** With the improvement of premature infant cure rate and livability, the incidence of PVL has been one of the main reasons for premature infant nervous system sequelae. miRNAs are important in the regulation of cell growth, differentiation, apoptosis and carcinogenesis. The aim of the present study was to identify differentially expressed miRNAs between PVL and normal tissues.

**METHODS:** The target genes of significant miRNA were retrieved from the miRecords database. Furthermore, GO analysis and biological process interaction network was constructed using the BiNGO and Cytoscape software. Finally, KEGG analysis from DAVID was used to find meaningful signaling pathway.

**RESULTS:** In conclusion, this study identified 16 differentially expressed miRNAs, which may be important in the progression of PVL and miRNA 141 demonstrated the greatest quantity of target genes. In addition, Hdac4, Lamc1, Irs1 and Zeb1 are the most frequently appeared ones among proved genes. Wnt signaling pathway and Neurotrophin signaling pathway were identified to be significantly associated with PVL.

**CONCLUSION:** This work may bring some new hints for the pathogenesis of PVL in the future work. However, further investigation regarding the specific function is required.

## INTRODUCTION

With the improvement of premature infant cure rate and livability, the incidence of PVL, which is one of the main reasons for premature infant nervous system sequelae, also increased significantly. Currently, it is reported that the incidence of PVL in very low birth weight (VLBW) infants

has already reached 4.2% (71/1680) in Taiwan (Tsai *et al.* 2015). Compared to that, the incidence of mainland in China was 2.3% (112/4933) in a survey performed by ten large hospitals of seven Chinese cities (Chen *et al.* 2011). The pathogeny of PVL is extremely complicated. It is basically characterized by two components: (1) focal necrosis in the periventricular region and (2) diffuse reactive

gliosis in the surrounding white matter (Folkerth 2006). However, the detailed mechanism is still not clear to date.

MiRNAs are important kinds of short endogenous RNAs found in recent years, through the way of direct decomposition of target mRNAs or suppress their translation regulate gene expression in transcription level, they play a very important role in development sequence, stem cells, signal transduction, cell growth and the occurrence of the tumor biological processes such necessary biological processes (Sayed & Abdellatif 2011). There're a few miRNA studies involved in brain diseases and normal brain development. But in point of PVL, rare miRNA studies have been reported.

In view of this situation, the aim of the present study was to identify the miRNAs, which may be important in the progression of PVL and to analyze their involvement in this process. In addition, an interaction network was constructed using the Search Tools for the Database for Annotation, Visualization and Integrated Discovery (DAVID) database and Cytoscape software. We hope this study maybe helpful for the new exploration of PVL pathogenesis such as the identification of new therapeutic targets.

## MATERIALS AND METHODS

### Wistar rats

All healthy adult rats (16 female rats and 16 male rats in total) were maintained in a specific pathogen-free animal facility at the animal center of Nanjing Medical University. These 16 mature pregnant wistar rats were then divided into PVL group ( $n=8$ ) and control group ( $n=8$ ) according to the randomized controlled standard. All procedures in this study followed the protocols approved by the Nanjing Medical University Animal Care and Use committee. The modeling and experimental methods are based on the previous reports (Guo *et al.* 2013; Bell & Hallenbeck 2002). Finally, in PVL group and control group, there were 70 and 82 neonatal rats, respectively.

### Microarray analysis

After RNA isolation from neonatal brain tissues, the miRCURY™ Hy3™/Hy5™ Power Labeling Kit (Exiqon, Vedbaek, Denmark) was used according to the manufacturer's guideline for miRNA labeling. Specific methods of microarray were performed as our previous report described (Bell & Hallenbeck 2002). Differentially expressed miRNAs were identified through fold change filtering and false discovery rate (fold change  $\geq 2.0$ ; false discovery rate  $< 0.05$ ).

### Predicting the target genes of differentially expressed miRNAs

The miRecords database (<http://miRecords.umn.edu/miRecords>), which is a resource for animal miRNA-target interactions, was used to analyze the target genes

of the specific miRNAs. miRecords integrates the predicted targets of the following miRNA target prediction tools: DIANA-microT (<http://diana.cslab.ece.ntua.gr/microT>), MicroInspector (<http://bioinfo.uni-plovdiv.bg/microinspector>), miRanda (<http://www.microrna.org/microrna/home.do>), MirTarget2 (<http://mirdb.org/miRDB>), miTarget™ (<http://cbit.snu.ac.kr/~miTarget>), NBmiRTar (<http://wotan.wistar.upenn.edu/NBmiRTar/login.php>), PicTar (<http://pictar.bio.nyu.edu>), PITA (<http://genie.weizmann.ac.il/index.html>), RNA22 (<http://cbcsrv.watson.ibm.com/rna22.html>), RNAhybrid (<http://bibiserv.techfak.uni-bielefeld.de/rnahybrid>) and TargetScan (<http://www.targetscan.org>). The genes that were predicted by at least three of the 10 databases were selected as miRNA targets for subsequent analysis to reduce the quantity of false-positive results.

### Network analysis and functional annotation

As an open source learning biological information processing software, Cytoscape (<http://www.cytoscape.org>) can be used for the information integration of biological molecules, genes, and etc. Therefore, this software was used to visualize these associations and the mined modules. Annotation was performed by the plugin (BiNGO v2.44) of Cytoscape software. Significance analysis including biological process was analyzed through this plugin.

### KEGG pathway

The Database for Annotation, Visualization and Integrated Discovery (DAVID; <http://david.abcc.ncifcrf.gov/>) includes a broad selection of functional annotation tools for understanding the biological significance of numerous genes. In the current study, database of Kyoto Encyclopedia of Genes and Genomes (KEGG) from DAVID was used to label the function of genes and perform the pathway enrichment analysis. Through Fisher Exact Test with the software, P value was calculated with a significant value of 0.05

### Statistical analysis

An independent sample *t*-test was used to identify the differentially expressed miRNAs between the PVL group and healthy control subjects, and  $p < 0.05$  was considered to indicate a statistically significant difference.

## RESULTS

### Identification of differentially expressed miRNAs

Raw data of miRNA expression was obtained from above experiments and a strict filter rule was applied (fold change  $\geq 2.0$ ; false discovery rate  $< 0.05$ ). Finally, 35 miRNAs exhibited significant differential expression (Table 1).

### Target gene prediction

Since miRNAs regulate the post-transcriptional regression of target genes, the putative target genes of specific

\*MFC: Mean Fold Change

miRNAs were retrieved from miRecords, which selects the target genes that have been retrieved by at least three databases. Furthermore, these target genes were searched for using PubMed. And a large list of target genes were identified to be close to PVL, some were already confirmed by references (Table 2).

#### Network analysis and functional annotation

The target genes of 16 differentially expressed miRNAs were input into BiNGO of Cytoscape software. Biological process was analyzed and 404 functional GO terms were collected at last. Functional analysis demonstrated that these genes were identified to be associated with the GO categories of brain development, generation of neurons, response to hypoxia, cell differentiation, cell death and etc (see Attachment). The Cytoscape was then used to visualize these associations (Figure 1).

#### KEGG pathway

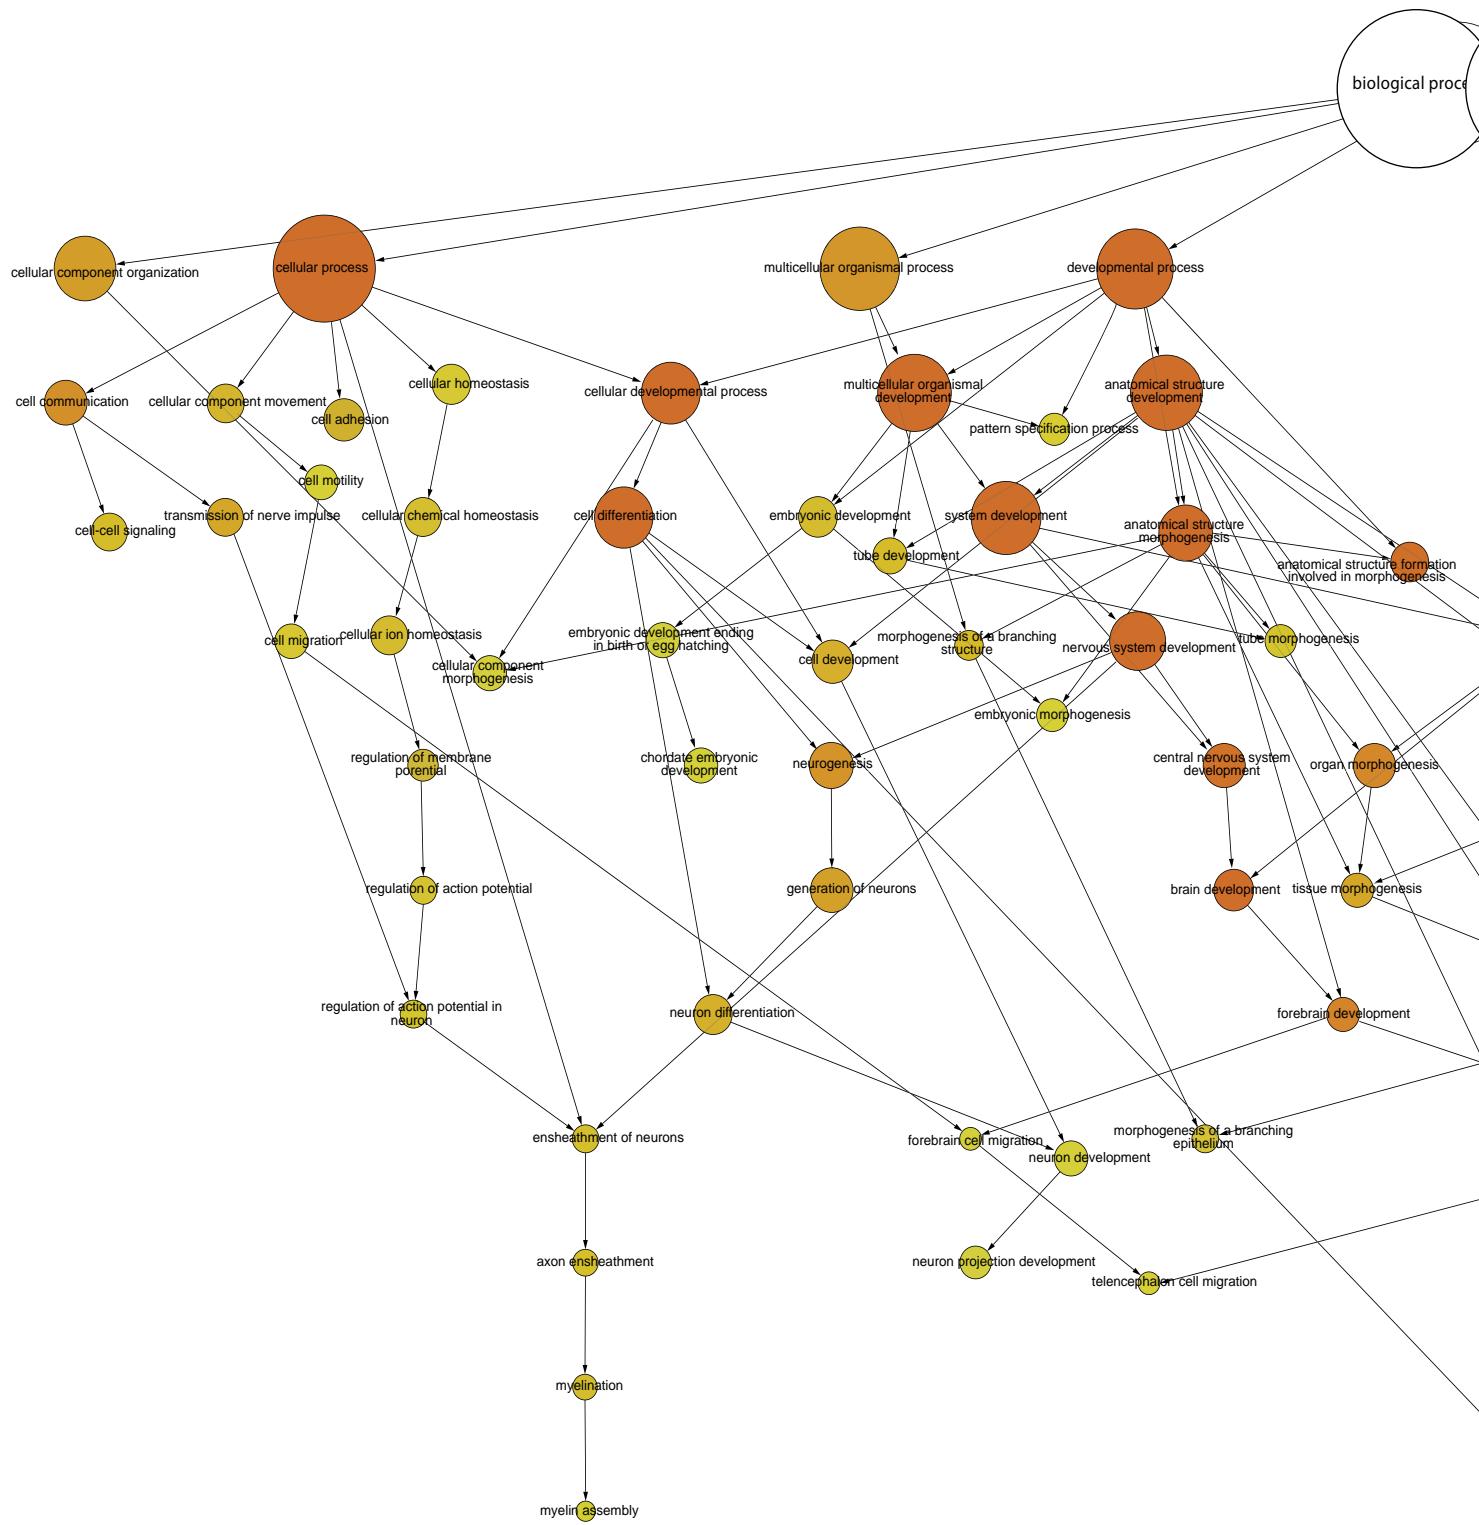

KEGG from DAVID was used to label the function of genes and perform the pathway enrichment analysis. Finally, 9 significant pathways including wnt signal-

ing pathway and neurotrophin signaling pathway were acquired (Table 3).

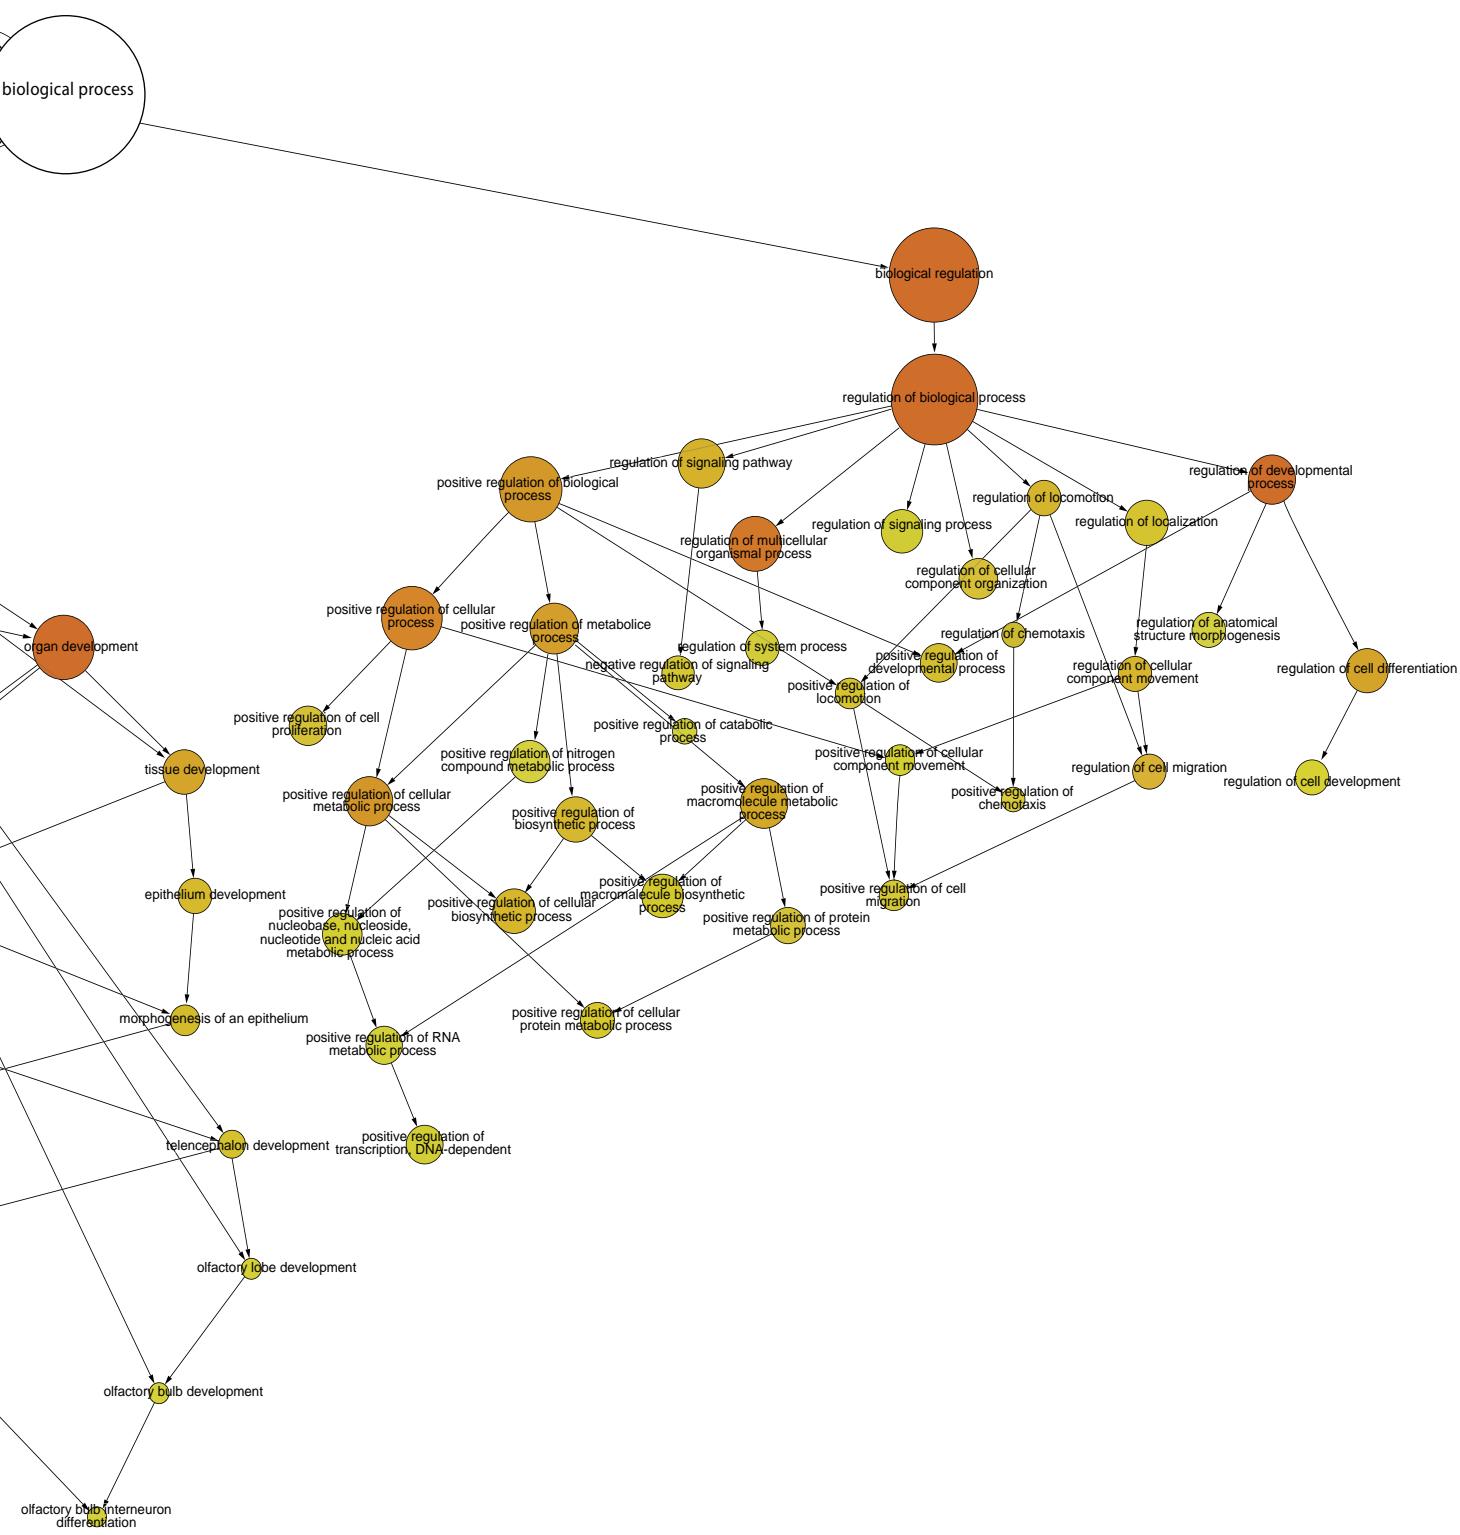

## DISCUSSION

In the present study, 35 differentially expressed miRNAs were first identified to exhibit a regulatory function in PVL. As a result of retrieving the target genes of the miRNAs from miRecords, a few of predicted targets of 16 significant miRNAs were found to be associated with PVL at last (showed in Table 1 and 2).

Though there haven't been miRNA studies reported directly related to PVL to date, some miRNA researches have already clarified how this small RNA participated in brain damage and neural development, such as miRNA-10a-5p, miRNA-29a/b and etc. Prins *et al.* (2014) once proved that the expression level of miRNA-10a-5p changed significantly in the dorsal and ventral hippocampus of rats during normal pubertal development and repeated binge-EtOH exposure. Similarly, miRNA-29 family is also an important kind of brain-specific miRNA, which is strongly expressed in neural

\*Target genes in bold italics were already confirmed by literature.

development and highly enriched in neurons of the olfactory bulb, the hippocampus and in the Purkinje cells of the cerebellum. Roshan *et al.* (2014) reported that miRNA-29 is a key determinant of neuronal cell survival in brain, and knockdown of miRNA-29 could result in neuronal cell death and ataxia in mice. In addition, Ouyang *et al.* (2014) demonstrated that miRNA-29a might emerge as a strategy for protection against ischemia-reperfusion injury. As is known to all, PVL is characterized by hypoxic ischemic necrotic lesions

leading to non-selective destruction of all cellular elements, including glia and blood vessels (Volpe 2009; Gilles & Gomez 2005). The immature white matter of both human beings and rodents is highly sensitive to altered oxygen tension during a critical developmental window prior to the onset of myelination (Wellmann *et al.* 2005). So, these new found miRNAs may be involved in PVL through the above pathological and physiological processes, although the exact mechanism is still not clear yet.

Beside these significant miRNAs, the target gene is another key point we emphasize. (1) Firstly, miRecords was used to screen the potential target genes, and miRNA-141 has the greatest quantity of predicted target genes (99 genes, showed in Table 2). Although there is no direct evidence in the aspect of PVL, Lee *et al.* (2012) observed that the inhibition of miRNA-141 activities in SHSY5Y cells makes these cells more tolerant to oxygen glucose deprivation-induced cell death. This may indirectly indicated that miRNA-141 may be involved in the progression of PVL by the similar mechanism. (2) Secondly, 41 above-mentioned genes had already been confirmed close to brain diseases by literature search (see genes in bold italics of Table 2). (3) Furthermore, among these proved genes, Hdac4, Lamc1, Irs1 and Zeb1 are the most frequently appeared ones. Interestingly, they are also proved closely related to hypoxic ischemic brain damage (Qian *et al.* 2006; Buga *et al.* 2014; Joseph *et al.* 2015; Minchenko *et al.* 2013). For example, Qian *et al.* proved that inhibition by small interfering RNA of HDAC4 could reduce HIF-1 alpha protein expression and its transcriptional activity (Qian *et al.* 2006). Moreover, Buga *et al.* found Lamc1 was one of the “New-for-stroke” genes that were linked to the increased vasculature density in young animal’s brains (Buga *et al.* 2014).

Through BiNGO and Cytoscape, various biological processes including neurogenesis and generation of neurons related to nervous system development were found under pathological and physiological conditions (see Attachment). Subsequently, several meaningful pathways were acquired by KEGG analysis (show in Table 3). Thereinto, Wnt signaling pathway attract our attention at first glance, Wang *et al.* once found hyperbaric oxygen treatment could promote the proliferation of neural stem cells in hypoxia-ischemia brain damage neonatal rats, which is correlated with the activation of

Wnt signaling (Wang *et al.* 2007). Neurotrophin signaling pathway is another interesting pathway, Galvin *et al.* reported that continuous low-dose treatment with brain-derived neurotrophic factor or neurotrophin-3 protects striatal medium spiny neurons from mild neonatal hypoxia/ischemia (Galvin & Oorschot 2003). These results suggested the potential pathways PVL involved in, though there haven’t direct evidences.

In conclusion, the current study identified 16 differentially expressed miRNAs, which may be important in the progression of PVL and miRNA-141 demonstrated the greatest quantity of target genes. In addition, Hdac4, Lamc1, Irs1 and Zeb1 are the most frequently appeared ones among proved genes. Wnt signaling pathway and Neurotrophin signaling pathway were identified to be significantly associated with PVL. However, further investigation regarding the specific function is required.
